Reproducibility Evaluation: Declarative Scenario-based Testing with RoadLogic (ICCPS26)

Prerequisites

- Docker

Quickstart

To reproduce the figures in the paper, just use the Dockerfile. The experiments run for about 10h in total on my Dell Latitude with a 12th Gen Intel(R) Core(TM) i7-1265U. Your mileage may vary (and the computation time with it).

- Inside this folder, run

```
docker build -t roadlogic-artifact .
```

- Run the container:

```
docker run --rm -it --name roadlogic-artifact roadlogic-artifact
```

- Run the script to reproduce the Figures from the paper

```
bash paper/reproduce_experiments.sh
```

- This part takes about 10h.
- Find the results under `paper/figures`
